

Meditate UX · Usability Research & Mobile Showcase

Human Factors International (HFI) certified usability study, heuristic evaluation, and high-fidelity mobile prototype.

Role: Certified Usability Analyst | Timeline: 2023 | Tools: Figma, Usability Testing, Heuristic Review, Maze

01 Context & Research Objective

Mindfulness and meditation applications often suffer from high initial drop-off due to onboarding fatigue and intrusive paywalls. The study aimed to evaluate user cognitive friction and design a serene, habit-forming experience.

Applied formal Human Factors International (HFI) user-centered design methodologies to uncover subconscious barriers to daily practice.

02 Heuristic Evaluation & Usability Testing

Conducted cognitive walkthroughs and heuristic reviews evaluating navigation hierarchy, feedback loops, and error prevention.

Recruited 12 participants across diverse experience levels for moderated task-based testing sessions.

Identified that over-categorized audio libraries caused decision paralysis during the critical first 60 seconds.

03 Design Solutions & Wireframe Prototyping

Designed a simplified 'One-Tap Calming Session' home widget tailored to the user's immediate emotional state.

Curated soothing color harmonies with soft ambient gradients and minimalist typography (Plus Jakarta Sans).

Constructed interactive Figma prototypes featuring micro-interactions for breathing pacing and session completion.

04 Testing Results & Usability Metrics

Task completion rate increased from 71% (baseline) to 94% on the redesigned prototype.

System Usability Scale (SUS) score improved to 88.5 (Grade A+ usability).

Average time to start a meditation session decreased from 48 seconds to 12 seconds.
